Hello, Can I add the following with no problems for a 32 bit copy of AutoCAD? Microsoft Visual C++ 2010 Express SP1 Microsoft Visual C++ 2008 Redistributable Package If so how do I get around the error messages? Thanks for any help given. A: You need to make sure that your computer has a native version of XP SP3 and either update your graphics drivers or install a new driver for the specific card in the computer. The AutoCAD software installer says that the product "will not support your system". Using a 32-bit application on a 64-bit operating system is probably a very bad idea in general and something you should avoid unless you know that your application requires a 32-bit operating system and can't be recompiled for a 64-bit operating system (an example of this might be an application that uses Flash and is only available in a 32-bit version of Windows). If you want to install your copy of AutoCAD on Windows 7 32-bit, go to the Microsoft Download Center and select Windows 7 32-bit. Q: error: top level class does not name a type I am working on what I believe should be a straightforward problem. I have a text file with a list of items. I am trying to separate the different parts of the list into different vectors. My project structure is such that I have list.txt item1 item2 item3 Then in my filePath.cpp I am trying to parse out the first item of the file, and after parsing it is given to an object #include #include #include #include using namespace std; vector words; vector ::iterator word; void File::ReadFile() { ifstream list; list.open("list.txt"); string line; while (getline(list, line)) { stringstream ss(line); int wordCount = 0; while (ss >> wordCount) { word
